Now prescribing KLYSIRI®

The latest technology in the fight against actinic keratoses with the shortest treatment regimen available:

- Only one daily application for 5 days
- Convenient single dose packaging
- More comfortable than other topical treatments
- No sun restrictions!

PROCEDURE SPOTLIGHT: CRYOSURGERY

Cryosurgery is a common treatment for multiple types of skin lesions, including: seborrheic keratoses, common warts, solar lentigos, actinic keratoses (precancers), and even some types of superficial skin cancers.

CRYO FAQ:

What is it and how does it work?

Liquid nitrogen is applied to bothersome and precancerous lesions, freezing the skin to subzero temperatures, causing the tissue of the undesirable lesion to be destroyed through a freezing and defrosting cycle. Multiple advantages of cryosurgery include: effectiveness, speedy treatment and recovery, less invasive, and often covered by insurance.

Is Cryosurgery painful?

Cryotherapy is an extremely tolerable treatment. We use a fine tipped applicator tip allowing extremely precise application with only intentional destruction of the desired lesion, avoiding damage to normal skin around the area. Patients can expect the area to have a slight burning or itching sensation for up to 15 minutes after procedure.

What is the recovery like?

Although treatment can take less than one minute, lesions heal over 1-2 weeks and more than one treatment may be needed. Please return for Re-evaluation if lesion not resolved.
